

Overlap with previous work

No work germinates on its own; it usually germinates on a fertile ground laid down by others. There were many conjectures on this Indus writing system by Asko Parbala, Iravatham Mahadevan and Brian Wells. I will briefly outline some of them and pointed out overlaps. Starting with interpretations for fish sign as “mīn” by father Heras in 1930s [1]. This was reiterated with caution by Iravatham Mahadevan [2]. If we look at the frequency of the syllables in Tamil (both modern and old), the one that comes on top is “ka” and not “ma” or “mi”. We know that the fish sign is the most frequent in Indus script, so the obvious Turing’s enigmatic result will be that the fish sign must start with “ka” and we found “kanni” is probably more feasible. However, our result was inspired by M.V.Bhaskar’s interpretation (personal communication) that the “Garial” (the river crocodile) is synonymous with fish and was probably trained and used as a boat. My own personal local customs also revealed that “kanni” is a term used commonly in earlier times for boat or any vehicle. This was probably dropped for its political correctness later on down the line by modern folks.

Many of Asko Parbala’s interpretations were based on correlations to planets and cosmology. This has close parallels with Indo-European cultural stream, the nomads for who the astrological guidance was crucial. This seem to have very little relevance to Indus script at all, as they were well-settled people of river valley. In fact, it is due to the lack of astrological skills that made the Tamils bring the brahmins from the North to help in predicting the seasons for them, and is also the reason for the term “parpan” (the see-er) that was used to call them.

There were many interpretations by Asko Parbala and Mahadevan [3] on the M77 sign-342 , including “-an”. M.V.Bhaskar was quite critical of this being male-centric, an apt criticism, as he found no preponderance of male domination in IVC art. The interpretation of sign-1  as “-an” has also been proposed by Bryan Wells [4] and then MVB’s criticism can be cleverly overcome by stating that “-an/-al” could have been sex-neutral term in those days and associating “-al” with feminine gender could have been a later invention by the feudal male-dominant society (especially as “-al” has connotation with darkness and evil). On the proposals of Iravatham Mahadevan and Bryan Wells’s interpretations of numbers as being semantically numbers, we found have no parallels in our interpretations. In fact, the numbers are the only signs that almost never reflected their standalone ideographic value. This was indeed quite surprising for us, as we found almost no evidence for this. MVB has been quite radical in this interpretation, in proposing that almost a new syllabic system can be conjured using just the numbers alone.

Bryan Wells’s work also proposes other possibilities like sign-358  being closely related to the Hare’s ears and so proposing the syllable “ce” from “cevi”. We are in full agreement with this proposal and in fact, both this and sign-76  also evokes the same “ce” syllables. In the IVC context of bronze-age, these have semantic connotations to “cembu” (bronze). Bryan Wells also proposed “ko” for sign-261  and “kota” for sign-267 . We are fully in agreement with these readings.

There could have been many more proposals that may have some overlap with our interpretations here. We would be glad include them in our document as soon as we are made aware of them.
